

Artificial Intelligence (AI) is the field of computer science focused on building systems that can perform tasks that normally require human intelligence.

Machine Learning is a subset of AI where models learn patterns from data instead of being explicitly programmed.

Large Language Models (LLMs) are machine learning models trained on large text datasets to understand and generate human-like language.

Retrieval-Augmented Generation (RAG) is a technique that combines information retrieval with text generation. It retrieves relevant documents from an external source and uses them to generate accurate, grounded answers.

Vector Databases store numerical embeddings of text and allow semantic similarity search.

ChromaDB is one such vector database commonly used in RAG systems.

RAG helps reduce hallucinations in LLMs by ensuring that answers are generated based on retrieved factual information instead of relying only on model memory.
